Python Expense Tracker

Master Personal Finance with Code

v1.0.0 | Project Showcase

Why Build This?

The Problem

Managing finances manually using spreadsheets or notebooks is tedious, prone to errors, and lacks real-time insights.

The Solution

A custom Python application that automates logging, categorizing, and visualizing expenses, providing a clear picture of financial health.

Core Functionalities

Add Expenses

Quickly log transactions with date, amount, category, and description.

View & Filter

Browse history and filter by specific categories or date ranges.

Visual Analytics

Generate charts to understand spending habits at a glance.

Technology Stack

Python 3.10+

The core logic language, chosen for its readability and rich ecosystem of libraries.

SQLite / CSV

Lightweight data persistence. SQLite offers robust querying, while CSV is great for portability.

Matplotlib / Pandas

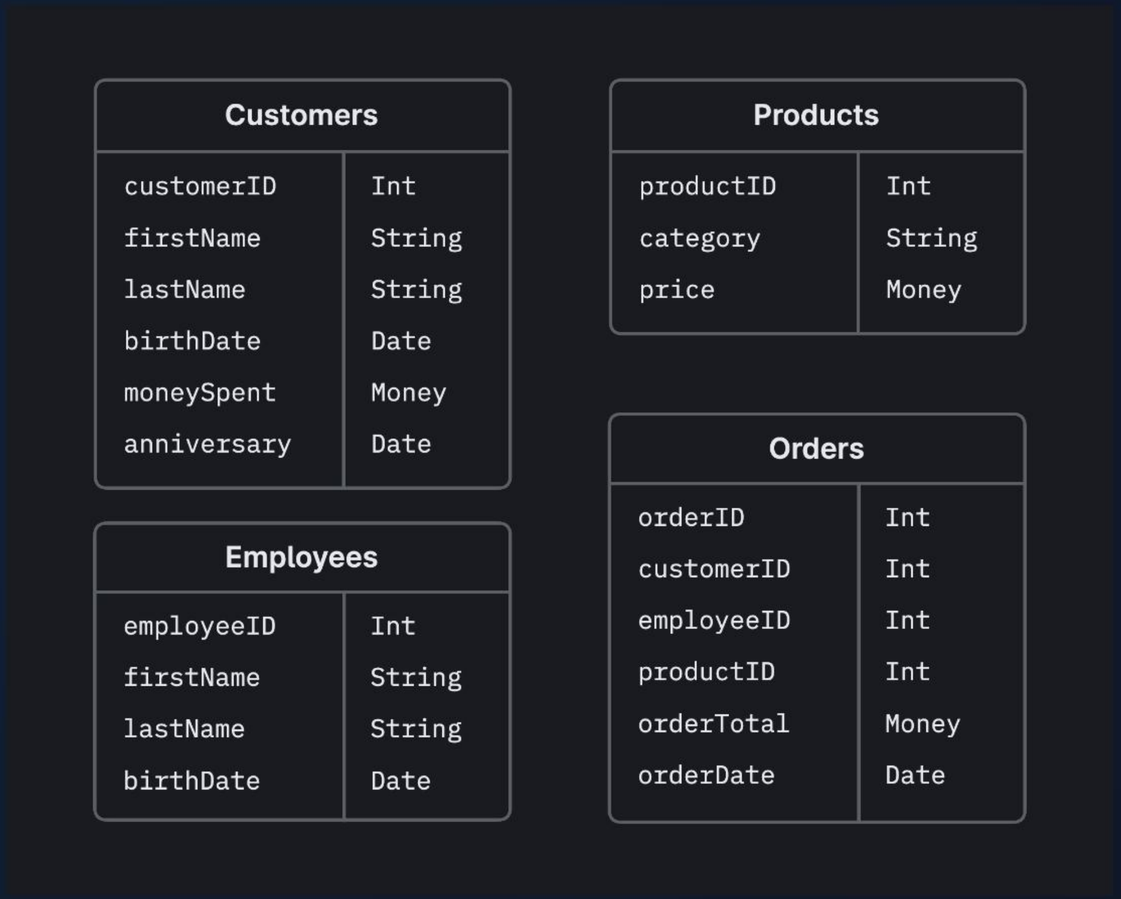
Powering the data analysis and visualization engine to render charts.

Tkinter / CustomTkinter

Provides a modern, dark-themed Graphical User Interface (GUI) for desktop use.

Database Design

Field	Type	Description
id	INTEGER PK	Unique identifier (Auto-inc)
date	TEXT	ISO Format (YYYY-MM-DD)
category	TEXT	Food, Travel, Utilities, etc.
amount	REAL	Transaction value
description	TEXT	Optional notes



Core Logic: Adding Data

```
import sqlite3 def add_expense(date, category, amount, desc): # Connect to the database conn = sqlite3.connect('f
```

Modern UI Design

Moving beyond the Command Line Interface (CLI), the project implements a clean Graphical User Interface.

- **Dark Mode:** Reduces eye strain for developers.
- **Responsive Inputs:** Validates dates and numbers in real-time.
- **Dashboard:** Immediate view of recent transactions.

Spending Analytics

A breakdown of monthly expenses allows users to identify spending leaks.

*Simulated data visualization rendered with CSS

Challenges & Solutions

Input Validation

Challenge: Users entering invalid dates or text in amount fields.
Solution: Try/Except blocks and Regex validation.

Data Persistence

Challenge: Saving data reliably without database locks.
Solution: Using SQLite Context Managers (`with conn:`) to ensure safe commits.

Future Improvements

- **AI Categorization:** Use NLP to automatically tag "Starbucks" as "Food/Drink".
- **Cloud Sync:** Migrate from local SQLite to Firebase/PostgreSQL for multi-device access.
- **Budget Alerts:** Set monthly limits and get notified when nearing them.
- **Export Reports:** Generate PDF or Excel summaries for tax purposes.

Take Control.

Building an expense tracker is not just about writing code; it's about building financial discipline through technology.

Q & A

Thank you for your time.
